## Fruit

- **Maturity** : Like Golden Clone B, beginning to half of September.
- **Colour** : Yellow. In some areas Parsi will develop à attractive red blush on the face of the fruits. In some places this can be up till 40%/
- **Presentation** : Form typically Golden, attractive and regular.
- **Size** : Parsi is able to develop big size fruits, depending on the thinning and other cultural conditions.
- **Skin** : Without russet. The typical characteristics from Golden are preserved; lightly long-shaped, lenticels, no greasing when mature. Because of the good skin quality, a very high number of fruits can be graded in first choice.
- **Conservation** : Very good. Golden Parsi can be stored until January in normal storage and in CA until the end of July.
- **Harvest** : Golden Parsi has a large Picking window; which offers the “real” Golden areas to pick from 3 to 4 weeks, depending on the conservation program. The variety is not sensible for pre harvest drop of.
- **Diseases** : No special problems compared to Golden Clone B.

## Tree

The tree is à easy grower without any special problems. In the most situations it will be necessary to use rootstock EM9. The vigour will be moderated if the production is regular.

- **Productivity** : Golden Parsi is very productive from one the first years. Often thinning will be necessary. Like the most varieties, to much production will have a negative influence at the taste of the apples and can stimulate bi-annuality the year after.

## Flowering

- **Flowering period** : Like Clone B: Breaburn +7, Gala +2.
- **Pollinators** : Golden Gem, Beaugene, Sprenger, Gala, Granny Smith, ...

**Origin** : South Tyrol, Italy

**Obtenteur** : KIKU LTD

**Main licence holder** : KIKU LTD
